

AsCode Solution

Sukoon

Complete Design System & UI/UX Specification

for the Inventory Management & POS System (Offline-Installable Windows Edition)

Client: Mr. Abdullah | Prepared By: AsCode Solution | Companion to: Full Technical Design & Development Specification

This document is the single source of truth for every visual, interaction, and content decision in the product. It is written to be handed to a coding agent (e.g. Claude Code) alongside the Development Specification. Where the two documents overlap, this document governs anything visual; the Development Specification governs anything architectural.

Table of Contents

(This field populates automatically when the document is opened in Microsoft Word. If it appears empty, right-click it and choose "Update Field".)

0. How to Use This Document

This document works together with the Development Specification. Read both before starting Phase 1. Specifically:

- The Development Specification defines what gets built, in what order, and how it is tested.
- This document defines exactly what it looks like, how it behaves, and why — down to hex codes, spacing values, animation durations, and copy tone.
- Every screen in Section 6 has a reference screenshot. Match these pixel-for-pixel where feasible; where the real data forces a different layout, preserve the spacing, type, and color rules from Section 3–4 rather than the exact screenshot proportions.
- A clickable HTML prototype (`sukoon_prototype.html`) is provided alongside this document. It is not throwaway — its CSS values (colors, radii, shadows, spacing) are the literal source of truth and may be read directly when in doubt.
- Section 13 is a design-specific Definition of Done checklist. Add it to every phase's existing DoD gate from the Development Specification — a phase is not done until it passes both.

1. Design Philosophy — Why This Looks the Way It Does

The product is named Sukoon (سکون) — Urdu/Hindi for calm, peace, and contentment. That is not a decorative choice; it is the design brief compressed into a word. Every decision in this document is in service of one outcome: the person looking at the screen — cashier, owner, or credit customer glancing at a receipt — should feel calm, capable, and trusted, regardless of their technical background.

1.1 The core move: push the machine out of sight

The previous design surfaced implementation details — database engines, print protocols, background workers — directly on working screens. That is backwards: those details are true and important, but they are the software's business, not the cashier's. This system draws a hard line:

- **Cashier- and customer-facing screens** (Till, Khata, receipts) never mention implementation. No database names, protocols, sync engines, or queue mechanics.
- **Owner-facing screens** (Insights) show business outcomes, not system internals.
- **Admin diagnostic detail** (printer status, backup state, storage size) lives exclusively in Settings — reached deliberately, never surfaced by default.

1.2 HCI and psychology principles applied

Principle	Where it shows up in this product
Progressive disclosure	Technical/system detail is one deliberate click away (Settings), never on the default view.
Recognition over recall	Product tiles use consistent color-coded category tags; payment methods are icons + labels, not a dropdown the cashier must remember to open.
Fitts's Law (target size vs. importance)	The highest-frequency, highest-stakes action (Complete Sale) is the single largest tappable element on the Till screen.
Miller's Law / cognitive load	Every screen has exactly one dominant number or focal point. The Till total is 44px bold; everything else recedes in size and weight around it.
Peak-end rule	The 'All done' confirmation is a deliberately unhurried, calm full-

Principle	Where it shows up in this product
	screen moment — this is the instant the cashier and customer remember, repeated hundreds of times a day.
Error prevention over error messages	Complete Sale is visually muted until the sale state is valid, rather than allowing a bad click and then apologizing with a red banner.
Color as signal, not decoration	One accent color (teal) is used for anything positive/actionable. Coral is reserved for things that genuinely need attention. If everything is colored, nothing is.
Consistency across contexts	The same card, pill, and button shapes recur everywhere. A cashier who has never seen the Insights screen already knows how it behaves.

1.3 What calm is not

Calm does not mean empty, slow, or short on information. Owners still get real numbers; admins still get real diagnostics. Calm means information is organized by a clear hierarchy, given room to breathe, and never announced in a way that manufactures urgency it doesn't deserve.

2. Brand Identity

2.1 Name

Sukoon (سكون) — calm, peace, contentment. Chosen deliberately over a generic descriptive name (e.g. "AsCode POS") because the name itself should carry the emotional promise of the product, and because it reads naturally and warmly in the market this shop operates in.

2.2 Logomark

A rounded square tile containing a small amber circle (sun) sitting above a single calm white arc (horizon/wave). The mark reads as a quiet dawn — literally and figuratively 'calm, first thing in the morning.' It is intentionally abstract at small sizes rather than trying to be legible as a literal sun — abstraction ages better as an icon.

The Sukoon mark: a calm dawn — sun above a horizon line.

Element	Spec
Container	30×30 base unit, 9px corner radius (30% of size) — scales proportionally at any size used
Container fill	#0E6B57 (Sukoon Teal)
Sun	Circle, #F4C567 (Sukoon Amber), centered, ~35% of tile width, positioned in the upper half
Horizon	Single white stroke, 2px at 30px tile size, gentle double-curve, lower third of tile
Minimum size	20px — do not use smaller; the mark loses legibility below this

Element	Spec
Clear space	Minimum 25% of tile width on all sides

2.3 Wordmark

Lowercase, set in Inter ExtraBold (800), tight letter-spacing (-0.02em). "suk" in the primary ink color, "oon" in Sukoon Teal — a small typographic wink that makes the calm half of the word literally colored calm.

2.4 Voice and tone

- Plain language over technical language, always. "Everything in the shop, at a glance" — not "Inventory Management Dashboard."
- Second person, direct, warm but not chatty. No exclamation marks. No forced enthusiasm.
- Numbers speak for themselves — copy doesn't editorialize good/bad news beyond what a neutral label communicates ("14 running low", not "Uh oh, 14 items critically low!").
- Urdu/local terms are kept where they carry real trust and meaning (Khata), not translated into cold English equivalents ("Credit Ledger").

3. Design Tokens

3.1 Color system

One accent color, used with restraint. Every other color in the palette is either neutral (ink/paper) or a status color used only for its specific semantic purpose — never decoratively.

Token	Hex	Usage
Ink (primary text)	#1C1C1E	All primary text and icons on light backgrounds
Ink Soft	#48484D	Secondary emphasis text (slightly lighter than primary)
Muted	#86868B	Labels, captions, timestamps, placeholder text
Faint	#B9B9BE	Tertiary text, disabled states, dividlegend text
Hairline	#E8E7E3	Borders and dividers — never pure black or grey
Paper (background)	#FAF9F6	App background — warm, not stark white
Surface	#FFFFFF	Cards, modals, elevated content
Sunk	#F2F1EC	Recessed/inset elements (input backgrounds, pill trays)
Sukoon Teal	#0E6B57	The one accent — primary actions, active states, positive emphasis
Teal Deep	#0A4F41	Text on teal-tinted backgrounds (for contrast)
Teal Tint	#E7F3EF	Light backgrounds for teal-toned callouts
Sukoon Amber	#B8873B	Caution / "needs attention" status only — never decorative
Amber Tint	#FBF3E4	Background for amber status pills
Sukoon Coral	#C15B45	Negative/urgent status only — deliberately not pure red
Coral Tint	#FBEEEE	Background for coral status pills

Token	Hex	Usage
Sky	#3E6FBF	Informational emphasis only (e.g. change due) — used sparingly
Sky Tint	#EAF1FC	Background for sky-toned callouts

Color usage rules

- Coral is never used for a state that is merely informational (e.g. an amount owed is not automatically coral — see Khata rules below). Coral is reserved for states requiring action or genuinely over a limit.
- A balance owed in Khata is shown in ordinary ink, not coral — owing money is the normal, expected state of that screen, not an error.
- Amber marks 'needs attention soon'; coral marks 'needs attention now'. Never use them interchangeably.
- No gradients except the two specified radial background washes (Login and Sale Complete screens) — flat color everywhere else.

3.2 Typography

Typeface: Inter, weights 400/500/600/700/800. Inter is chosen for the same reasons a system like SF Pro is chosen — humanist, neutral, exceptionally legible at small sizes on screen, and (unlike SF Pro) freely licensable for bundling inside a Windows installer.

Token	Size / Weight	Usage
Display	44px / 800, -0.02em	The one hero number per screen (Till total, Sale Complete total)
H1	32px / 800, -0.02em	Screen-level page titles where used standalone
H2	22–26px / 750, -0.01em	Section headers, card hero numbers (dashboard stats)
H3	16.5px / 700	Card titles, subsection headers
Body	14–14.5px / 650	Primary interactive text — product names, customer names, button labels
Body Secondary	12–13px / 500–600	Supporting metadata — SKUs, timestamps, helper text
Caption / Eyebrow	11–12px / 700, uppercase, 0.02–0.04em tracking	Section labels ("HOW ARE THEY PAYING?"), table headers

Number formatting

- Currency always shown as "Rs 6,640" — space after Rs, comma thousands separator, no decimal places for whole-rupee amounts.
- Large stat numbers (dashboard, catalog size) use tabular/lining figures so digits align in columns.
- Never abbreviate currency on a primary total (no "6.6k"); abbreviation ("Rs 38.4L") is acceptable only in a small supporting stat card, never the hero number of a transaction.

3.3 Spacing, radius, and elevation

Token	Value	Usage
Spacing unit	8px base grid	All padding/margin values are multiples of this
Card padding	20–28px	Standard breathing room inside any card or panel
Radius — large	22px	Hero cards, modals
Radius — medium	16–20px	Standard cards, list containers, buttons
Radius — small	11–13px	Small pills, inline controls, stepper buttons
Radius — pill	999px (full)	Status badges, filter chips
Shadow — card	0 1px 1px rgba(0,0,0,.02), 0 6–8px 16–22px rgba(0,0,0,.035–.045)	Default resting elevation for any card
Shadow — floating	0 8–20px 20–50px, tinted with the element's own color at ~20–30% opacity	Primary buttons and hero elements — a colored glow, not a grey shadow

3.4 Iconography

Lucide icon set exclusively (open-source, MIT-licensed, consistent 2px stroke line-icon style). Never mix in a different icon family or emoji for functional UI. Stroke width 1.8–2.4px depending on icon size, always rounded line caps/joins.

- Icon color follows text color rules — muted grey by default, ink or teal only when the icon itself is the active/selected indicator.
- Icons are always paired with a text label in navigation — never icon-only for primary nav, to avoid relying on recall of what an icon means.

4. Component Library

4.1 Buttons

Variant	Look	Use for
Primary	Solid Sukoon Teal, white text, floating colored shadow	The one main action on a screen or panel (Complete Sale, Confirm update)
Outline	Transparent fill, 1.5px hairline border, ink-soft text	Secondary actions alongside a primary (Send reminder, Print receipt)
Ghost	Sunk background, ink-soft text, no border	Tertiary/dismissive actions (Cancel)
Large (btn-lg)	Full width, 18–19px vertical padding, 18px radius	The single full-width action closing out a flow (Complete Sale)

Button states

- Default → Hover: shadow intensifies slightly, no color shift (avoid the dated "darken on hover" pattern).
- Disabled: background becomes Sunk grey, text becomes Faint, shadow removed entirely — visually inert, not just dimmed.
- A primary action button is disabled (not hidden) until its required state is valid, so the layout never jumps.

4.2 Cards

White surface, card-elevation shadow, 16–22px radius depending on hierarchy level (larger radius = higher-level container). Cards never have a visible border in addition to their shadow — pick one depth cue, not both, to avoid visual noise.

4.3 Status pills

Always: tinted background + matching darker text of the same hue + optional small dot. Pills never use solid saturated fills with white text except for the count badges on filter chips (All · 184) which intentionally read as more prominent/selected.

4.4 Avatars

Circular, initials-based (no photo dependency — a shop's staff and customer list will rarely have photos available, and initials avoid an awkward broken-image state). Background is always Teal Tint 2 (#D6ECE4) with Teal Deep text, regardless of the person's identity — consistent, calm, never assigning arbitrary colors per person.

4.5 Modals and overlays

- Backdrop: ink color at 38–50% opacity, never pure black.
- Modal itself: Surface white, 26px radius, strong but soft shadow (0 30px 70px rgba(0,0,0,.25)).
- Always dismissible by clicking the backdrop or an explicit close control — never a dead-end modal.
- Full-screen overlays (Login, Sale Complete) use the radial calm-wash background, not a plain white or dimmed backdrop — these are moments, not utilitarian dialogs.

4.6 Toasts

Bottom-center, dark ink background, white text, appears with a short upward slide and fades after ~2.2 seconds. Used only for lightweight confirmations of actions that don't need a full modal (e.g. "Stock updated"). Never used for errors that require the person to act — those get inline treatment instead.

5. Layout & Navigation

Every authenticated screen shares the same skeleton: a persistent icon rail on the far left, a top bar with screen title and identity, and a content region beneath it. This consistency is deliberate — the frame never changes, only the content inside it, which reduces re-orientation cost every time a person switches screens.

The rail

- 78px wide, fixed, persistent across every screen except the full-screen Login and Sale Complete moments.

- Four primary destinations — Till, Stock, Khata, Insights — plus Settings pinned to the bottom, visually separated from the primary set.
- The active destination is a solid Teal tile with a colored floating shadow; inactive destinations are icon + muted label only.

The top bar

- 72px tall. Left: screen title (H1-ish weight but smaller, ~19px/800) plus a one-line muted subtitle giving context, not a generic description.
- Right: a quiet sync-status dot (only on cashier-relevant screens — Till, Stock; omitted on Insights/Settings where it isn't relevant) and the current staff member's avatar + name + role.

Minimum window size and resize behavior

Design at 1440×960 as the primary target (a typical small shop-PC monitor). Below approximately 1200px width, the Khata and Settings two-column layouts should collapse the left list panel to an overlay/drawer rather than compressing both columns — preserve comfortable reading width over fitting both columns at all costs.

6. Screen-by-Screen Specification

Each screen below references its screenshot in the accompanying assets. Treat the screenshot as ground truth for spacing and hierarchy; the prose describes intent and interaction, which matters more than pixel-matching when real data doesn't fit the mock content shown.

Login — Quick Staff Switch

Figure 1 — Staff avatar selection and PIN pad.

Purpose: get a staff member into the till in under five seconds, with zero typing beyond a 4-digit PIN. Replaces a conventional username/password form entirely.

- Tapping a staff avatar selects them (visual ring + checkmark); this is a visual confirmation only, selection does not require a separate submit step.

- The PIN pad auto-submits the instant a 4th digit is entered — no explicit "Log in" button, removing one unnecessary tap.
- The system status line at the bottom is intentionally the least visually prominent element on the screen — present for reassurance, not for attention.
- Greeting text ("Good morning, Abdullah") is time-of-day aware: Good morning / afternoon / evening based on device clock.

Till — Point of Sale & Checkout

Figure 2 — The core, highest-frequency screen in the product.

Purpose: let a cashier build a cart and take payment as fast as physically possible, with the total always the single most visually dominant element on screen.

- The scan/search field is always focused by default and remains the top-left anchor of the screen at all times — a cashier should never have to click into it.
- Cart rows show a struck-through original price beside an active discount, so a promo is visible and legible without needing a separate 'why is this discounted' click.
- Payment method selection (Cash / Card / Khata) is three large equal-weight pills, not a dropdown — recognition over recall, and large enough to hit without precision aiming.
- The 'Cash received' quick-amount buttons anticipate the most common tender amounts; 'Change to return' only appears for cash and is colored Sky, not Teal or Coral, since it's informational rather than an action or a warning.
- Complete Sale repeats the total amount directly on the button — the cashier's eye never has to travel back up to confirm what they're about to charge.

Stock — Inventory at a Glance

Figure 3 — Catalog health and per-item stock levels.

Purpose: let an owner or admin see the health of the whole shop's inventory in one glance, and drill into any single item without leaving the list.

- Stock level is always shown as a labeled bar, not a bare number — 'healthy' vs. 'low' is legible at a glance even to someone skimming, without reading exact figures.
- Badges (Low / Restock) use Amber and Coral respectively — proportional urgency, not uniform alarm.
- Clicking any row opens the Add Stock modal (Section 6, Figure 7) pre-filled for that product — a single consistent entry point for every stock change, whether adding, removing, or correcting a count.

Khata — Credit Customers & Ledger

Figure 4 — Who owes what, and the full transaction history behind it.

Purpose: give an owner complete confidence in credit customer balances without the ledger feeling like an accusation.

- The term Khata is used deliberately throughout — it is the trusted, familiar word for this exact kind of running credit account in the local market, and translating it to something like 'Credit Ledger' would make the feature feel colder and less legitimate to the person relying on it.
- A customer's outstanding balance is shown in ordinary ink by default — only a customer meaningfully near or over their credit limit (see Malik Zahid Enterprise in the reference screenshot) is flagged in coral, and only in the list, not the ledger detail.
- The ledger itself reads left-to-right as a plain chronological story (date → what happened → amount → running balance) rather than a double-entry accounting table — legible to someone with no bookkeeping background.
- The WhatsApp confirmation strip at the bottom of the detail view exists to build trust that the customer was actually notified — without making WhatsApp mechanics (queues, retries, provider names) visible here; that detail lives only in Settings.

Insights — Daily Performance Dashboard

Figure 5 — Sales, credit exposure, and profit, at a glance.

Purpose: answer 'how did today go' in the first three seconds of looking at the screen, then let the owner dig deeper only if they want to.

- Exactly one hero metric (today's sales) is given the large teal card treatment; every other number is visually secondary by comparison, even though all are important.
- The credit-outstanding figure is colored coral here (unlike in Khata) because in this aggregate, business-health context, a large or growing number genuinely does warrant the owner's attention — context changes the appropriate color, not the number itself.
- The activity feed reads as a story of the day (time → who → how they paid → how much), matching the same row language used in Khata's ledger, for consistency across the whole app.

Settings — Store Setup & Diagnostics

Figure 6 — Where all system/technical detail intentionally lives.

Purpose: this is the one screen in the entire product where technical, implementation-level detail is appropriate and expected — an admin arrived here specifically to check on it.

- Hardware status (printer, scanner, cash drawer) is shown as a simple Ready/Checking pill — calm even here, because the audience for this screen is still a shop owner, not a developer.
- Local data size, backup timing, and WhatsApp queue depth are exactly the kind of detail that was removed from the Till and Dashboard — it belongs here instead, not nowhere.
- Even here, raw technical nouns (SQLite, WAL mode, ESC/POS, APScheduler) are avoided in the copy shown to the user; the underlying system can and should use those technologies, but the words displayed stay in plain language.

Add Stock — Inventory Adjustment Modal

The screenshot displays a 'Stock' management interface. A modal for 'Dalda Cooking Oil 5L Can' is open, showing a 'Stock in' action. The current stock is 8 units, and the new stock level is 20 units. A reason 'Supplier delivery - PO-8821' is selected. The background shows a list of other stock items.

Item	GRN	Category	Price
Dalda Cooking Oil 5L Can	OIL-5021	Cooking Oils & Ghee	Rs 2,850
Sunridge Chakki Atta 10kg	GRN-1014	Grains & Flours	Rs 1,450
Tapal Danedar Tea 900g	BEV-3042	Beverages & Tea	Rs 1,650

Figure 7 — Stock-in, stock-out, and count correction in one flow.

Purpose: make the single most common inventory action (receiving new stock) take under ten seconds, while keeping the rarer actions (stock-out, correction) equally accessible without extra screens.

- The three-way segmented control (Stock in / Stock out / Correct count) replaces what would otherwise be three separate forms or a confusing dropdown.
- The 'New stock level' preview updates live as the quantity changes, so the admin confirms the resulting number before committing — never commits blind.
- A reason is required for every adjustment (visible here as a pre-filled example) — this is the audit trail the previous design exposed as raw log text; here it's just a normal, calm form field.

Sale Complete — The Peak-End Moment

Figure 8 — The single most important screen in the product, psychologically.

Purpose: this is deliberately the calmest, least rushed moment in the entire app. People remember the peak and the end of a repeated experience far more than the middle — ending every one of hundreds of daily transactions with genuine calm, rather than a beep and an instant reset, is what actually builds trust in the software over time.

- The checkmark, headline, and change-due figure are the only things on screen — no navigation, no distractions, full-bleed calm background.
- 'Start next sale' is the only required action; the screen also offers an auto-advance countdown so an idle cashier isn't stuck waiting on a screen that has nothing left to ask them.
- Receipt options (print / WhatsApp) are secondary, outline-style buttons — available, not pushed.

Printed Receipt — 80mm Thermal Layout

Figure 9 — What actually comes out of the printer, at true print width.

Purpose: the physical receipt is the one artifact of this software that leaves the shop and sits in a customer's pocket — it deserves the same care as any on-screen moment.

- Laid out at genuine 80mm thermal-printer proportions, not a generic invoice template — dashed rule dividers mimic the visual language of an actual thermal print rather than a solid-line spreadsheet border.
- The logomark appears even on the printed receipt — brand consistency extends past the screen.
- Closing line ("Thank you. Come again.") is warm without being effusive, matching the voice rules in Section 2.4.

7. Motion & Interaction

Motion is used to communicate state changes calmly, never to decorate or delight for its own sake. Every transition answers a specific question for the person: did that register? where did this come from? where did it go?

Interaction	Motion	Duration / easing
View switch (rail navigation)	Instant swap — no slide/fade	0ms — orientation should feel immediate, not staged
Modal open	Backdrop fades in, modal scales up very slightly from 98%→100%	180–220ms ease-out
Toast	Slides up 20px + fades in; reverse on dismiss	250ms ease, auto-dismiss after 2.2s
Button press	Shadow lifts slightly; no color darkening	120–150ms ease
Sale Complete entrance	Checkmark circle scales in from 80%, headline fades in ~80ms after	300ms ease-out, staggered

If in doubt, prefer no animation over an uncertain one — a static but instant interface reads as more trustworthy than a laggy or over-animated one on modest shop-PC hardware.

8. Accessibility & Inclusive Design

- Minimum tap target: 44×44px for anything interactive, larger (64–76px) for the highest-frequency controls (numpad, cart quantity steppers) — shop PCs are frequently touch-enabled.
- Text contrast: primary ink (#1C1C1E) on paper (#FAF9F6) exceeds WCAG AA at all body sizes used. Status pill text-on-tint combinations were chosen to individually pass AA for their font size.
- Status is never color-only: every status pill pairs its color with a text label ("Low", "Restock", "Ready") so the product remains legible to colorblind users.
- Font sizes are defined in relative units in implementation so a person can increase OS/browser zoom without breaking layout — verify this explicitly in Phase 1 rather than assuming it.
- Urdu/RTL: not required for v1, but avoid hardcoding left-to-right assumptions into component logic (e.g. 'margin-right for icon spacing') where a simple logical-property alternative exists, to keep a future Urdu UI pass realistic rather than a rewrite.

9. Content & Voice Guidelines

Empty states

Never a bare blank screen. State what's true and, where useful, the one next action — plainly.

Example: an empty cart reads "Nothing in the cart yet — scan or search to add an item," not "No items found."

Error messages

State what happened and what to do next, without blaming the person or the software. Avoid technical error codes on any cashier-facing screen; log the technical detail internally and in Settings/diagnostics only.

Confirmations

Toasts and inline confirmations are short, plain-past-tense statements of fact: "Stock updated," "Reminder sent on WhatsApp" — never "Success!" or an exclamation mark.

10. Mapping to the Technical Stack

This section translates the design tokens above into the actual implementation stack agreed in the Development Specification: Flask + Jinja2, htmx, Alpine.js, and Tailwind CSS, packaged offline (no CDN dependency, matching the offline-first requirement).

10.1 Fonts and icons ship locally, not from a CDN

- Bundle Inter (weights 400/500/600/700/800, woff2) as local static files served by Flask — do not reference Google Fonts or any external CDN, since the app must work with no internet connection.
- Bundle the Lucide icon set locally (as inline SVG partials or a local sprite) for the same offline reason.
- Tailwind is compiled once at build time into a static CSS file and shipped inside the installer — no Tailwind CDN script tag, ever, in the shipped app.

10.2 Tailwind theme extension (starting point)

```
// tailwind.config.js — theme.extend, derived from Section 3 tokens
colors: {
  ink: '#1C1C1E', inkSoft: '#48484D', muted: '#86868B', faint: '#B9B9BE',
  hairline: '#E8E7E3', paper: '#FAF9F6', surface: '#FFFFFF', sunk: '#F2F1EC',
  teal: { DEFAULT: '#0E6B57', deep: '#0A4F41', tint: '#E7F3EF', tint2: '#D6ECE4' },
  amber: { DEFAULT: '#B8873B', tint: '#FBF3E4' },
  coral: { DEFAULT: '#C15B45', tint: '#FBEEEE' },
  sky: { DEFAULT: '#3E6FBF', tint: '#EAF1FC' },
},
borderRadius: { lg: '22px', md: '16px', sm: '11px' },
fontFamily: { sans: ['Inter', 'sans-serif'] },
```

10.3 htmx patterns

- Cart quantity +/- and payment-method selection: htmx partial swap of just the affected fragment (cart row total, order summary panel) — not a full-page reload, matching the 'instant view switch' motion rule in Section 7.
- Add Stock modal: loaded via an htmx GET into a modal container already present in the base template, rather than a separate route/page — keeps the calm, instant-feeling interaction model from the prototype.
- Sale completion: htmx POST that swaps the whole main content area for the Sale Complete view, matching the full-screen 'moment' behavior — this is one of the few places a full-region swap is correct, since it is meant to feel like a distinct moment, not an inline update.

10.4 Alpine.js patterns

- PIN pad state (digits entered, dot fill) — pure client-side Alpine state, no server round-trip until the 4th digit triggers the login POST.
- Modal open/close state and payment-method active-pill toggling — Alpine `x-data`/`x-show`, mirroring the vanilla-JS behavior already proven in the clickable prototype.
- Toast queue — a small Alpine component matching the prototype's `toast()` function behavior (message, 2.2s auto-dismiss, slide transition).

10.5 The prototype is the reference implementation for interaction, not just visuals

sukoon_prototype.html already implements — in plain JS, as a stand-in for Alpine — every interaction described in 10.3/10.4: view switching, modal open/close, PIN entry, payment-method toggling, and quantity steppers. When implementing the real Flask/htmx/Alpine version, this file is the fastest way to confirm exact intended behavior for any interaction that feels ambiguous in prose.

11. Asset & File Organization

Path	Contents
/static/fonts/	Inter woff2 files, all five weights used
/static/icons/	Local Lucide SVG partials actually used by the product (don't bundle the full icon set)
/static/css/tailwind.css	Compiled, purged Tailwind output — the only stylesheet shipped
/static/img/brand/	Logomark SVG (master), plus any exported PNG sizes needed for the installer icon / favicon
/docs/design/	This document, the prototype HTML file, and the reference screenshots

Path	Contents
	— kept alongside /docs/adr and /docs/context.md from the Development Specification

12. Relationship to the Development Specification

This document governs UI/UX from Phase 1 onward. Specifically:

- Phase 1 (Core Data Model & Auth): implement the Login screen exactly per Section 6, Figure 1, including PIN-based quick switch — this replaces any generic username/password assumption.
- Phase 3 (POS & Billing): the Till screen (Figure 2) and Sale Complete moment (Figure 8) are both in scope for this phase's UI, not just the backend logic — the peak-end moment is a functional requirement, not a cosmetic add-on.
- Phase 2 (Inventory): the Add Stock modal (Figure 7) is the one and only entry point for stock changes — do not build a separate full-page form as an alternative.
- Phase 4 (Credit Customers): use the term Khata throughout the UI, per Section 2.4 and Section 6, Figure 4 — do not substitute 'Credit Ledger' or similar in shipped copy.
- Phase 6 (Reports): the Insights screen (Figure 5) hierarchy — one hero metric, secondary stats, then detail — is a requirement, not a suggestion for how to arrange whatever reports get built.
- Phase 7 (Windows Packaging): Section 10.1's offline-asset rule (no CDN dependencies for fonts/icons/Tailwind) is a hard requirement for the installer to function without internet, and should be verified explicitly in that phase's offline smoke test.
- Any grill-with-docs session touching visual or interaction decisions should treat this document as the current accepted baseline — propose changes as amendments here, not silent deviations in code.

13. Design Definition of Done (Add to Every Phase Gate)

In addition to the functional Definition of Done in the Development Specification, no phase that touches UI closes until all of the following are true:

- ☐ No cashier- or customer-facing screen displays a technical/implementation term (database names, protocols, internal job/queue mechanics).
- ☐ Every screen has exactly one dominant visual focal point — if two elements compete for primary attention, one has been demoted.
- ☐ Every negative/urgent state uses Sukoon Coral, never a saturated pure red; every caution state uses Sukoon Amber, never orange or yellow.
- ☐ Every status indicator pairs color with a text label — no color-only meaning anywhere.
- ☐ Every primary action button is at least 44×44px, and the single highest-frequency action on the screen is the visually largest control.
- ☐ Every interactive element has a visibly distinct default, hover, and disabled state.
- ☐ All fonts and icons are served locally — zero external CDN requests anywhere in the shipped app, verified with the network adapter disabled.
- ☐ Copy has been checked against Section 9 — no exclamation marks, no blame-toned error text, no bare empty states.
- ☐ The screen has been compared side-by-side against its reference screenshot in this document, and any deliberate deviation is noted in context.md.

Appendix — Quick Reference: Full Color Token Table

Token	Hex
Ink	#1C1C1E
Ink Soft	#48484D
Muted	#86868B
Faint	#B9B9BE
Hairline	#E8E7E3
Paper	#FAF9F6
Surface	#FFFFFF
Sunk	#F2F1EC
Sukoon Teal	#0E6B57
Teal Deep	#0A4F41
Teal Tint	#E7F3EF
Teal Tint 2	#D6ECE4
Sukoon Amber	#B8873B
Amber Tint	#FBF3E4
Sukoon Coral	#C15B45
Coral Tint	#FBEEEA
Sky	#3E6FBF
Sky Tint	#EAF1FC

End of specification. Together with the Development Specification, </docs/context.md>, </docs/adr/>, </docs/glossary.md>, and [sukoon_prototype.html](#), this document is the complete and current source of truth for how Sukoon should look, feel, and behave.
