Upgrading to Sukoon 1.2.0

For the main shop computer, the one Sukoon was first installed on. About ten minutes, including two new settings. Your sales, stock, khatas and staff accounts all carry over.

> Before it changes anything, Sukoon makes its own copy of all your data. If anything goes wrong during the upgrade, it puts that copy back and does not start. Nothing is lost.

What is new

- **Your product list goes in all at once. Stock → Import** reads your spreadsheet, shows you the items to decide about (the same item listed twice, items with no price), then adds the rest in one go. A new screen lets you scan each item's barcode on, correct prices and categories, and type how many are on the shelf.
- **Prices with paisa.** Rs 150.50 stays Rs 150.50, on the bill and in the total. Change, card payments and khatas are exact too.
- **A new receipt.** Items in a table, in capital letters, the date as 28-Oct-2026, no cashier name, the total in bold, and your shop's name, address and phone at the bottom. It uses the full width of 80 mm paper.
- **The till only sells what is in stock.** An item with 0 in stock cannot be sold. Typing part of a name that matches several items lists them to choose from.
- **The stock list** shows each item's cost price and low-stock level.

Important: stock must be entered before items can be sold

From this version, an item with **0 in stock cannot be rung up**. Items you have already received into stock sell as before. Anything new, including everything you import, needs its quantity entered first: in the import's barcode screen (the `In stock` box), or in **Stock → the item → Stock in**. If a cashier finds an item on the shelf that Sukoon calls "out of stock", an Admin enters its stock and the cashier tries again.

Before you start

- [ ] Pick a quiet moment with **no sale in progress at any counter**. Every counter will stop working for a minute or two.
- [ ] Use the **main shop computer**. The other counters only use a web browser, so they need nothing.
- [ ] Have `Sukoon-Setup-1.2.0.exe` on this computer, on a USB stick or downloaded. Have your shop's address and phone number to hand.

The upgrade

1. **Double-click `Sukoon-Setup-1.2.0.exe`.**
   Windows will say **"Windows protected your PC"**, as before. Click `More info`, then `Run anyway`.
   When Windows asks whether to allow changes, click `Yes`.

2. **Click through the installer.**
   You don't need to close Sukoon first; the installer closes it for you. The other counters will show that they cannot connect until it finishes.

3. **Wait.**
   Sukoon backs up your data, then brings it up to date. This takes a minute or two. Don't switch the computer off.

4. **Click `Finish`, with `Open Sukoon now` ticked, and sign in as the owner.**

5. **Check that it all came across.**
   Open **Khata**: your customers and balances should be exactly as they were. Open **Insights**: today's sales should be there. Press `F5` on each of the other counters.

6. **Enter your shop's details.**
   Go to **Settings** → **Shop details**, check the name, type the `Address` and `Phone`, and press `Save`. They print at the bottom of every receipt.

7. **Print a test receipt.**
   In **Settings** → **Receipt printer**, press `Print a test receipt`. Your shop's name should print large, and three number lines (rulers) print below it. If the **48** ruler fits on one line, you're done. If it runs onto a second line, choose `80 mm paper — 42 characters a line` under `Receipt width` and press `Save`. Please send a photo of the test receipt to the developer.

If something goes wrong

If a message says **"Sukoon is installed, but needs attention"**, or Sukoon does not open, **your data is safe**: Sukoon put back the copy it took and did not change anything. Don't delete anything and don't install again. Call the developer, and keep these two files from the main computer for them:

`C:\ProgramData\Sukoon\install.log` and `C:\ProgramData\Sukoon\logs\sukoon.log`

Importing your product list

The developer will send you a prepared file (`sukoon-products-import.csv`). Go to **Stock** → **Import**, choose the file and press `Read the file`. Nothing is added yet. Work down the page:

- **Choose which to keep**: the same item listed more than once with different prices. Tick the one to keep and press `Keep ticked`, or `Skip all of these`.
- **Need a selling price**: type a price and press `Set price`, or skip.
- Press `Add … to stock`. Items you haven't decided about stay on the page for later.

Then, on **Scan barcodes & correct**, take items from the shelf one at a time: type a few letters of the name and press `Enter`, type how many are on the shelf in `In stock`, then scan the item's barcode. It is saved and leaves the list. Changing a selling price there asks for your password. If the wrong file was imported, `Undo this import` at the bottom of the import page takes it all back.
